Hello,

The following submission has been created.

Track Name: Integrated Devices and Circuits

Paper ID: 1016

Paper Title: AI-Powered Mental Health Analysis Using Speech and Text

Abstract:
In today’s busy environment, mental health awareness at a personalized level is an essential component of overall wellness. The stigma attached to receiving mental health treatment and high cost of treatment are the main reason that most people do not receive adequate care for mental health. The rapid growth of smartphones and internet provides unique opportunity and solution to bridge the gap in mental health treatment through technology. The present research focuses on developing a context-sensitive model with personalized recommendation engine for emotions. This model will provide a cost-effective solution for mental health care to each individual through small daily use gadgets at initial stage without meeting to doctors in-person. DAIR-AI Emotion dataset has been employed to evaluate proposed model and to provide initial mental-health screening. The model has achieved an accuracy of 89.85% and precision of 90.78% and exhibits good performance as compared to the standard BERT based model.
